

Portfolio Building:-

Name: Sirigiri Anand Kumar

Program: 3rd Semester B.Tech, Computer Science & Information Technology (CSIT),
REVA University, Bengaluru

Career Objective: Aspiring Software Developer, Web Developer, and AI Engineer targeting core technical roles in top technology companies.

Lab Activities 1–4 Recap:

- **Activities 1 & 2 (Environment & Version Control):** Configured VS Code, set up Git and GitHub version control workflows, and initialized the foundational hello-world repository.
- **Activity 3 (Pair Programming & Collaboration):** Practiced collaborative engineering and remote pair programming using VS Code Live Share and GitLens for commit tracking.
- **Activity 4 (Algorithmic Problem Solving):** Built a structured leetcode-solutions repository to systematically document solutions in Java and C while analyzing algorithmic time and space complexities.

Core Skills: Python, Java, C, C++, SQL, Git, GitHub, Vercel, Antigravity IDE, Data Structures, AI integration, and prompt engineering.

Initial Prompt:

Briefed the AI assistant to act as a frontend engineer and generate a single-file index.html featuring a Cyber-Terminal Glassmorphic theme, dark palette, responsive layout, and project cards linking to my GitHub repositories.

Follow-up Prompt 1:

"Ensure all project repository links and GitHub profile buttons have target="_blank" and rel="noopener noreferrer" so they open cleanly in a new tab without leaving the portfolio page."

- **Change Note:** Updated anchor tags to open repository links in external tabs, preserving user presence on the main portfolio.

Follow-up Prompt 2:

"Shorten the About section to three punchy sentences, and update the footer to include: 'CSIT Department • REVA University • Class of 2028!'"

- **Change Note:** Streamlined hero copy for readability and added complete academic cohort details to the footer.

Reflection (Section 3):

Prompting an AI assistant to scaffold the portfolio drastically accelerated the initial CSS and layout design compared to hand-coding from scratch. The initial prompt produced the biggest leap in visual aesthetics, establishing the custom cyber-terminal glassmorphic theme. However, the AI initially overlooked making repository links open in new tabs, which was corrected through targeted follow-up prompting without touching any code manually.
